Apache2 : Could not reliably determine the server's fully qualified domain name, using ::1 for ServerName

Symptômes

Lorsque vous essayez de (re)lancer le serveur apache2, le message ci-dessus apparaît.

Solution

Editer le fichier apache2.conf :

```
nano /etc/apache2/apache2.conf  
ajouter : ServerName localhost  
puis enregistrer et quitter (ctrl + x et o)  
service apache2 restart
```
